SPECIAL AND GENERAL
PURPOSE CATHODE RAY TUBES

NOTES:

1. A socket with a center opening to clear the tubulation should be used. Care should be taken in handling the tube to avoid damaging the exposed tubulation and bending the base pins.
2. Brilliance and definition decrease with decreasing accelerator voltage. In general, accelerator voltage should not be less than 7000 volts.
3. Visual extinction of the undeflected focused spot.
4. Measured per MIL-E-1 specification at an anode current of $400 \mu\text{a}$.
5. The center of the undeflected focused spot will fall within a circle of 1/2-inch radius concentric with the center of the tube face with the tube shielded.
6. Focusing coil current measured at an accelerator current of $100 \mu\text{a}$, with the center of air gap of JEDEC Focus Coil No. 127, or equivalent, located 2-1/2 inches from reference line.
7. The P16, P19, and P25 screens can be permanently damaged if current density is permitted to rise too high. To prevent burning, minimum beam current densities should be employed.

WARNING:

X-ray radiation shielding may be necessary to protect against possible danger of personal injury from prolonged exposure at close range if this tube is operated at higher than the manufacturer's Maximum Rated Anode Voltage or 16,000 volts, whichever is less.

OUTLINE

DIAGRAM NOTE:

1. Reference line is determined by the point where leading edge of JEDEC G-112 reference line gauge (a cylinder 2' long and 1.500' + .003-.000' I.D.) will stop.
