PENTAGRID AMPLIFIER

7-Pin Miniature Type With Two Independent Control Grids

For Use in "Hybrid" Automobile Receivers
Operating Directly From 12-Volt Storage Batteries

TENTATIVE DATA

RCA-12EG6 is a pentagrid amplifier of the 7-pin miniature type intended for use as a radio-frequency amplifier tube in "hybrid" automobile receivers in which the tube and transistor electrode voltages are obtained directly from a 12-volt storage battery.

The design of this tube permits use of both grid No. 1 and grid No. 3 as independent control electrodes. This feature provides for improved automatic volume control under large-signal conditions when both grids are biased by the avc voltage.

OPERATING CONSIDERATIONS

The *maximum ratings* in the tabulated data are estimated in accordance with the following definition of the *Design-Center Rating System* for rating electron devices:

Design-Center ratings are limiting values of operating and environmental conditions applicable to a bogey electron device of a specified type as defined by its published data, and should not be exceeded under normal conditions.

The device manufacturer chooses these values to provide acceptable serviceability of the device in average applications, taking responsibility for normal changes in operating conditions due to rated supply voltage variation*, equipment component variation, equipment control adjustment, load variation, signal variation, environmental conditions, and variations in device characteristics.

The equipment manufacturer should design so that initially no design-center value for the intended service is exceeded with a bogey device in equipment operating at the stated normal supply voltage.*

* For automotive equipment utilizing a 12-volt system, battery-voltage range of 10.0 volts to 15.9 volts is accepted U.S.A. practice.
