NOTES:

1. For series operation of heaters, equipment should be designed that at normal supply voltage bogey tubes will operate at this value of heater current.
2. Heater warm-up time is defined as the time required for the voltage across the heater to reach 80% of the rated heater voltage after applying four (4) times rated heater voltage to a circuit consisting of the tube heater in series with a resistance equal to three (3) times the rated heater voltage divided by the rated heater current.
3. Heater voltage supply variations shall be restricted to maintain heater current within the specified values.
4. External shield No. 316 connected to Pin No. 7 (cathode).

APPLICATION

The Sylvania 18GD6A is a miniature sharp-cutoff pentode featuring a 100 ma heater with controlled heater warm-up time. It is designed for RF and IF applications in AC/DC type radio receivers. Type 18GD6A replaces obsolete Type 18GD6.
