DATA

General:

Electron Guns, Three with Axes Tilted

Toward Tube Axis Blue, Green, Red

Heater, for Unipotential Cathode of

Each Gun, Paralleled with Each of

the Other Two Heaters within Tube:

Voltage 6.3 ac or dc volts

Current $1.8 \pm 10\%$ amp

Direct Interelectrode Capacitances (Approx.):

Grid No.1 of any gun to all other

electrodes except the No.1 grids

of the other two guns. 7 μf

Cathode of blue gun + cathode of green

gun + cathode of red gun to all

other electrodes 16 μf

Grid No.3 (Of each gun tied within

tube to No.3 grids of other two

guns) to all other electrodes. 9 μf External conductive coating to grid No.6. $\begin{cases} 2500 \text{ max.} \\ 2000 \text{ min.} \end{cases}$ μf $\begin{cases} 2500 \text{ max.} \\ 2000 \text{ min.} \end{cases}$ μf

Faceplate, Spherical Filterglass

Light transmission (Approx.) 72%

Screen, on Inner Surface of Faceplate:

Type Aluminized, Tricolor, Phosphor-Dot

Phosphor (Three separate phosphors, collectively). P22

Fluorescence and phosphorescence of

separate phosphors, respectively Blue, Green, Red

Persistence of group phosphorescence Medium

Dot arrangement. Triangular group consisting of

blue dot, green dot, and red dot

Spacing between centers of adjacent dot trios (Approx.) 0.029"

Size (Minimum):

Greatest width 19-1/4"

Height 15-1/2"

Projected area 261 sq. in.

Focusing Method. Electrostatic

Convergence Method Magnetic

Deflection Method. Magnetic

Deflection Angles (Approx.):

Horizontal 70°

Vertical 55°

Tube Dimensions:

Overall length 25-1/32" $\pm$ 3/8"Diameter 20-13/16" $\pm$ 1/8"

Weight (Approx.) 36-1/2 lbs

Operating Position Tube Axis Horizontal

(Base pin 12 and V-grooved panel pad on top)

Basing Designation for BOTTOM VIEW	14AL
Pin 1-Heater	Pin 13-Cathode
Pin 2-Grid No.1 of Red Gun	of Blue Gun
Pin 3-Grid No.2 of Red Gun	Pin 14-Heater
Pin 4-Cathode of Red Gun	Cap Over
Pin 5-Cathode of Green Gun	Pin 1-Ultor
Pin 6-Grid No.1 of Green Gun	(Grid No.4, Grid No.5)
Pin 7-Grid No.2 of Green Gun	Cap Over
Pin 9-Grid No.3	Pin 2-Grid No.6, Collector, High-
Pin 11-Grid No.2 of Blue Gun	Voltage- Supply
Pin 12-Grid No.1 of Blue Gun	Terminal
	C-External Conductive Coating

**Maximum Ratings, Design-Center Values:**

ULTOR-TO-CATHODE (Of each gun) VOLTAGE. . . 25000 max. volts
Between the Ultor Terminal and the High-Voltage-Supply Terminal (*See Dimensional Outline*), it is necessary to connect a resistor of 50,000 ohms as described under *Limiting Circuit Values*. The high voltage must be connected to the High-Voltage-Supply Terminal—never directly to the Ultor Terminal.

GRID-No.3-TO-CATHODE (Of each gun) VOLTAGE. 6000 max. volts

GRID-No.2-TO-CATHODE VOLTAGE (Each gun) . . 600 max. volts

GRID-No.1-TO-CATHODE VOLTAGE (Each gun):

Negative bias value 400 max. volts

Positive bias value 0 max. volts

Positive peak value 2 max. volts

PEAK HEATER-CATHODE VOLTAGE (Each gun):

Heater negative with respect to cathode:

During equipment warm-up period

not exceeding 15 seconds. 410 max. volts

After equipment warm-up period. 180 max. volts

Heater positive with respect to cathode . 180 max. volts

Equipment Design Ranges:

With ultor voltage (E_{c4k} each gun) between 20000* and 25000 volts

Grid-No.3 (Focusing

Electrode)-to-Cathode

(Of each gun) Voltage . 16.8% to 20% of E_{c4k} each gun volts

Maximum Raster Shift in Any

Direction from Screen Center[□] . . 7/8 inch

Maximum Required Displacements

of Beam Trios with Respect to

Associated Phosphor-Dot Trios:

Uniform in any direction over

entire screen area 0.005"*

◆ Connect high-voltage supply to this cap and also connect 50,000-ohm resistor between this cap and cap over pin 1 (Ultor cap).

* Brilliance and definition decrease with decreasing ultor voltage. In general, the ultor voltage should not be less than 20,000 volts.

* If this displacement is accomplished by means of a purifying magnet located on the neck of the tube, the equivalent raster movement is about 3/4".

□: See next page.

COLOR PICTURE TUBE

Localized around edge of screen—

Tangential. 0.002"

Radial. 0.003"

Adjustment to be Provided by

the Following Components:

Lateral-Converging Magnet:[Ⓢ]Maximum lateral shift of blue beam. $\pm 1/4"$ Maximum lateral shift of red beam and
green beam. $\pm 1/8"$ to $\pm 3/8"$ Average of maximum lateral shift
of red beam and green beam. $\pm 7/32"$ to $\pm 9/32"$ Radial-Converging Magnet Assembly:[Ⓢ]For static convergence including
compensation for dc component
of dynamic convergence(Each beam) Shift of $\pm 5/8"$ For dynamic convergence:[†]Effected by magnetomotive force
of parabolic and/or sawtooth
waveshape synchronized with
scanning.

Horizontal:

Blue pattern—

Parabola amplitude to
provide[▲]. Shift of $3/16"$ to $1/2"$ Sawtooth amplitude to
provide[Ⓢ]. Shift of $\pm 50\%$ of the
shift caused by pa-
rabola amplitude

Red pattern & green pattern—

Parabola:

Amplitude to provide[▲]. Shift of $1/16"$ to $5/16"$ Ratio of red-pattern shift
to green-pattern shift. $2/3$ to $3/2$

Sawtooth:

Amplitude to provide[Ⓢ]. Shift of -60% to $+60\%$
of the shift caused by
parabola amplitudeDifference between red-pattern
shift and green-pattern shift(Shift_R - Shift_G) -75% to $+75\%$

[Ⓢ] Centering of the raster on the screen may be accomplished by passing direct current of the required value through each pair of deflecting coils to compensate for raster shift resulting from adjustments for optimum convergence and color purity.

[▲] Shift is the movement of the regions of dot/crosshatch-generator pattern indicated in notes ([▲]) and ([Ⓢ]).

[Ⓢ] The direction of movement of the red and green beam is opposite to that of the blue beam.

[†] Indicated values apply when RCA test yoke is used with the 21CYP22.

[▲], [Ⓢ]: See next page.

Grid-No.1-to-Cathode Voltage (Each gun) for Visual Extinction of Focused Raster when circuit design utilizes grid-No.2-to-cathode voltage of 200 volts.	-45 to -100	-45 to -100	volts

Limiting Circuit Values:**High-Voltage Circuits:**

In order to minimize the possibility of damage to the tube caused by a momentary internal arc, it is recommended that the *high-voltage power supply* and the *grid-No.3 power supply* be of the limited-energy type with inherent regulation to limit the continuous short-circuit current to 50

[▲] The parabola amplitude is determined by the average value of the shifts at the extremities of the respective horizontal and vertical axes of the screen with convergence of the three beams maintained at the center of the screen. An increase in amplitude should move the blue beam toward the top of the screen; the red beam toward the lower left of the screen; and the green beam toward the lower right of the screen.

^{○○} The sawtooth amplitude is determined by the difference between the shifts at the extremities of the respective horizontal and vertical axes of the screen. Positive amplitude indicates that the shift at the right or bottom of the screen is greater than the shift at the left or top of the screen.

21CYP22

COLOR PICTURE TUBE

milliamperes. In addition, to prevent cathode damage with resultant decrease in tube life, an external resistor having a value of 50,000 ohms must be connected between the two bulb terminals and the effective resistance between the grid-No.3 power-supply output capacitor and the grid-No.3 electrode should not be less than 50,000 ohms. These resistances should be capable of withstanding the maximum instantaneous currents and voltages in their respective circuits. It is to be noted that the high voltage must be connected only to the High-Voltage-Supply Terminal—*never directly to the Ultor Terminal*. A resistor of 50,000 ohms must be connected between the Ultor Terminal and the High-Voltage-Supply Terminal.

In equipment utilizing a well-regulated ultor power supply, the *grid-No.3-circuit resistance* should be limited to 7.5 megohms.

Low-Voltage Circuits:

Effective Grid-No.1-to-Cathode—

Circuit Resistance (Each gun). 0.75 max. megohm

When the cathode of each gun is not connected directly to the heater, the grid-No.2-to-heater circuit, the grid-No.1-to-heater circuit, and the cathode-to-heater circuit should each have an impedance such that their respective power sources in combination will not supply an instantaneous or continuous short-circuit current of more than 300 milliamperes total. Such current limitation will prevent heater burnout in case of a momentary internal arc within the tube.

When the cathode is connected directly to the heater, the grid-No.2-to-heater circuit, and the grid-No.1-to-heater circuit should each have an impedance such that their respective power sources in combination will not supply an instantaneous or continuous short-circuit current of more than 300 milliamperes total. Such current limitation will prevent heater burnout in case of a momentary internal arc within the tube.

DEFINITIONS

Beam trio. The red beam, green beam, and blue beam passing through a common hole in the shadow mask.

Register. Exact correspondence in position of the centers of beam trios with respect to the centers of the associated phosphor-dot trios.

Misregister. Lack of correspondence in position of the centers of the beam trios with respect to the centers of the center of the associated phosphor-dot trios.

Displacement. Shift of the position of the beams with respect to the phosphor dots.

GENERAL CONSIDERATIONS

X-Ray Warning. Because the 21CYP22 is designed to be operated at ultor voltages as high as 25 kilovolts (design-center maximum value), shielding of the 21CYP22 for X-ray radiation may be needed to protect against possible injury from prolonged exposure at close range.

21CYP22

COLOR PICTURE TUBE

21CYP22

Shatter-Proof Cover Over the Tube Face. Following conventional picture-tube practice, it is recommended that the cabinet be provided with a shatter-proof, glass cover over the face of the 21CYP22 to protect it from being struck accidentally and to protect against possible damage resulting from tube implosion under some abnormal condition. This safety cover can also provide X-ray protection when required.

High Voltages. The high voltages at which cathode-ray tubes are operated may be very dangerous. Great care should be taken in the design of apparatus to prevent the operator from coming in contact with the high voltages. Precautions include the enclosing of high-potential terminals and the use of interlocking switches to break the primary circuit of the power supply when access to the equipment is required.
