CIRCUIT VALUES

Grid No. 1 Circuit Resistance	1.5 Megohms Max.
---	------------------

NOTES:

1. Heater warm-up time is defined as the time required for the voltage across the heater to reach 80% of the rated heater voltage after applying four (4) times rated heater voltage to a circuit consisting of the tube heater in series with a resistance equal to three (3) times the rated heater voltage divided by the rated heater current.
2. External conductive coating must be grounded.
3. Voltages are positive with respect to Grid No. 1 unless indicated otherwise.
4. Visual extinction of focused raster. Extinction of stationary focused spot will require that these values be about 5 volts more positive.

WARNING:

X-ray radiation shielding may be necessary to protect against possible danger of personal injury from prolonged exposure at close range if this tube is operated at higher than the manufacturer's Maximum Rated Anode Voltage or 16,000 volts, whichever is less.

OUTLINE

DIAGRAM NOTES:

- Reference line is determined by Plane C-C' of JEDEC No. 126 Reference Line Gauge, when the gauge is seated against the bulb.
- Base Pin No. 4 aligns with horizontal centerline (A-A') within 30° and is on same side as anode contact, J1-21.
- Planes perpendicular to the axis and passing through Points X, Y and Z are located as follows:
 Plane tangent to crown of face, to plane of X = 0.785 " Nom.
 Plane of X to plane of Y = $0.463 \pm .030$
 Plane of X to plane of Z = $0.970 \pm .030$
