- (1) The grid n°4 voltage required for optimum focus of any individual tube may have a value anywhere between 0 and 400 volts. It is independent of anode current and will remain essentially constant for values of anode voltage or grid n°2 voltage within design ranges shown for these items.

It is necessary to provide means such^{as} a potentiometer for adjusting the focusing voltage.

NOTES for DIMENSIONAL OUTLINE

- Note 1 - The plane through the tube axis and pin 4 vary from the plane through the tube axis and anode terminal by angular tolerance (measured about the axis) of $\pm 30^\circ$. Anode terminal is on same side as pin 4.
- Note 2 - Socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. The design of the socket should be such that the circuit wiring cannot impress lateral strains through the socket contacts on the base pins. Bottom circumference of base wafer will fall within a circle concentric with bulb axis and having a diameter of $1 \frac{3}{4}$ ".
- Note 3 - Width of undisturbed region between mold-match line and splice line is $19/32$ " minimum. This should be the maximum width of tube support band.
- Note 4 - With tube neck inserted through flared end of the reference-line gauge JEDEC G.126 and with tube seated in gauge, the reference-line is determined by the intersection of the plane CC' of the gauge with the glass funnel.
