CIRCUIT VALUES

Grid No. 1 Resistance	1.5 Megohms Max.
---------------------------------	------------------

NOTES:

- 1. Heater warm-up time is defined as the time required for the voltage across the heater to reach 80 % of the rated heater voltage after applying four (4) times rated heater voltage to a circuit consisting of the tube heater in series with a resistance equal to three (3) times the rated heater voltage divided by the rated heater current.
- 2. External conductive coating and rim band must be grounded.
- 3. Voltages are positive with respect to cathode unless otherwise indicated.
- 4. Voltages are positive with respect to Grid No. 1 unless otherwise indicated.
- 5. Visual extinction of focused raster. Extinction of stationary focused spot will require that the absolute value of the bias between cathode and grid No. 1 be increased by about 5 volts.
- 6. Tubes will have satisfactory focus at some value between -200 and +200 volts.

WARNING:

X-ray radiation shielding may be necessary to protect against possible danger of personal injury from prolonged exposure at close range if this tube is operated at higher than the manufacturer's Maximum Rated Anode Voltage or 16,000 volts, whichever is less.

DIAGRAM NOTES:

- Reference Line is determined by plane C-C' of JEDEC No. 126 Reference Line Gauge, when the gauge is seated against the bulb.
- Base Pin No. 4 aligns with horizontal centerline (A-A') within 30° and is on same side as anode contact, J1-21.
