

TECHNICAL DATA

3CX20,000A7

HIGH-MU
POWER TRIODE

The EIMAC 3CX20,000A7 is a ceramic/metal power triode intended for use as a zero-bias Class B rf amplifier or Class C power amplifier or oscillator. Class B operation with zero grid bias offers circuit simplicity by eliminating the bias supply. In addition, grounded-grid operation is attractive since a power gain as high as twenty times can be obtained with the 3CX20,000A7.

GENERAL CHARACTERISTICS¹

ELECTRICAL

Filament: Thoriated Tungsten

Voltage	6.3 ± 0.3 V
Current, at 6.3 volts	160 A
Amplification Factor (Average):	200
Direct Interelectrode Capacitance (grounded cathode) ²	
Cin	61.0 pF
Cout	0.2 pF
Cgp	36 pF

Direct Interelectrode Capacitance (grounded grid)²

Cin	61.0 pF
Cout	36 pF
Cpk	0.2 pF

Frequency of Maximum Rating:

CW	110 MHz
----------	---------

1. Characteristics and operating values are based upon performance tests. These figures may change without notice as the result of additional data or product refinement. EIMAC Division of Varian should be consulted before using this information for final equipment design.

2. Capacitance values are for a cold tube as measured in a special shielded fixture in accordance with Electronic Industries Association Standard RS-191.

MECHANICAL

Overall Dimensions:

Length	8.50 in; 215.9 mm
Diameter	8.25 in; 209.6 mm
Net Weight	13.5 lb; 6.15 kg
Operating Position	Vertical base up or down

Maximum Operating Temperature:

Ceramic/Metal Seals	250°C
Anode Core	250°C

Cooling Forced air
 Base Coaxial
 Recommended Air System Socket SK-1300 or SK-1320

RADIO FREQUENCY LINEAR AMPLIFIER CATHODE DRIVEN

Class AB

ABSOLUTE MAXIMUM RATINGS

DC PLATE VOLTAGE 8000 VOLTS
 DC PLATE CURRENT 6.0 AMPERES
 PLATE DISSIPATION 20,000 WATTS
 GRID DISSIPATION 500 WATTS

1. Approximate values.
 2. Adjust to obtain specified value.

TYPICAL OPERATION (Frequencies to 110 MHz) Class AB₂

Plate Voltage 7000 7000 Vdc
 Grid Voltage 0 0 Vdc
 Zero-Signal Plate Current¹ 6 .6 Adc
 Single-Tone Plate Current² 5.92 5.0 Adc
 Single-Tone Grid Current¹ 1.22 1.0 Adc
 Driving Power¹ 1750 1540 W
 Plate Dissipation 13.4 10.8 kW
 Single-Tone Plate Output Power 29.6 24.2 kW
 Resonant Load Impedance 693 745 Ω
 Drive Impedance 27 32 Ω

RADIO FREQUENCY POWER AMPLIFIER OR OSCILLATOR Class C Telephony or FM

Grid Driven

DC PLATE VOLTAGE 8000 VOLTS
 DC GRID VOLTAGE -500 VOLTS
 DC PLATE CURRENT 5.0 AMPERES
 PLATE DISSIPATION 20,000 WATTS
 GRID DISSIPATION 500 WATTS

TYPICAL OPERATION (Frequencies to 110 MHz)

Plate Voltage 7000 Vdc
 Grid Voltage -230 Vdc
 Plate Current 4.0 Adc
 Grid Current¹ 775 mAdc
 Peak rf Grid Voltage¹ 555 v
 Calculated Driving Power¹ 430 W
 Plate Input Power 28 kW
 Plate Dissipation 6.7 kW
 Plate Output Power 21.3 kW
 Resonant Load Impedance 963 Ω
 1. Approximate value.

RADIO FREQUENCY POWER AMPLIFIER

Class C Cathode Driven

ABSOLUTE MAXIMUM RATINGS:

DC PLATE VOLTAGE 8000 VOLTS
 DC GRID VOLTAGE -500 VOLTS
 DC PLATE CURRENT 5.0 AMPERES
 PLATE DISSIPATION 20,000 WATTS
 GRID DISSIPATION 500 WATTS

TYPICAL OPERATION

Plate Voltage 7200 7800 Vdc
 Grid to Cathode Voltage -200 -200 Vdc
 Plate Current 3.7 4.2 Adc
 Grid Current¹ 92 98 mAdc
 Peak rf Cathode Voltage¹ 480 500 v
 Cathode Driving Power¹ 1900 2300 W
 Plate Dissipation 4500 5000 kW
 Plate Load Resistance 1080 1020 Ω
 Plate Output Power 22.0 27.5 kW
 1. Approximate value.

RADIO FREQUENCY POWER AMPLIFIER

Class B Television Service, Cathode Driven

ABSOLUTE MAXIMUM RATINGS

DC PLATE VOLTAGE 8000 VOLTS
 DC PLATE CURRENT 6.0 AMPERES
 PLATE DISSIPATION 20,000 WATTS
 GRID DISSIPATION 500 WATTS

TYPICAL OPERATION (Frequencies to 216 MHz) Class B

Plate Voltage 7200 Vdc

Grid Voltage 0 Vdc
 Zero Signal Plate Current¹ 1.2 Adc
 Effective rf Load Resistance 605 Ω
 Plate Current: Blanking Level 4.8 Adc
 Sync. Peak Level 5.8 Adc
 Grid Current: Blanking Level¹ 0.47 Adc
 Sync. Peak Level¹ 1.14 Adc
 rf Cathode Voltage Peak:
 Blanking Level¹ 230 v
 Sync. Peak Level¹ 300 v
 Driving Power: Blanking Level¹ 690 w
 Sync. Peak Level¹ 1700 w
 Plate Power Output: Blanking Level 16.5 kw
 Sync. Peak Level 27.5 kw

1. Approximate value.

NOTE: TYPICAL OPERATION data are obtained by measurement or calculation from published characteristic curves. Adjustment of the rf grid voltage to obtain the specified plate current at the specified bias, and plate voltages is assumed. If this procedure is followed, there will be little variation in output power when the tube is changed, even though there may be some variation in grid current. The grid current which results when the desired plate current is obtained is incidental and varies from tube to tube. These current variations cause no difficulty so long as the circuit maintains the correct voltage in the presence of the variations in current. If grid bias is obtained principally by means of a grid resistor, the resistor must be adjustable to obtain the required bias voltage when the correct rf grid voltage is applied.

RANGE VALUES FOR EQUIPMENT DESIGN

	<u>Min.</u>	<u>Max.</u>
Heater: Current at 6.3 volts	152	168 A
Cathode Warmup Time	5.0	--- sec.
Interelectrode Capacitances (grounded grid) ¹		
Cin	55.0	67.0 pF
Cout	32.0	40.0 pF
Cpk	---	0.3 pF
Interelectrode Capacitances (grounded cathode) ¹		
Cin	55.0	67.0 pF
Cout	---	0.3 pF
Cgp	32.0	40.0 pF

1. Capacitance values are for a cold tube as measured in a shielded fixture in accordance with Electronic Industries Association Standard RS-191.

APPLICATION

MOUNTING & SOCKETING - The 3CX20,000A7 must be operated vertically, base up or down, and should be protected from severe shock and vibration. The use of an EIMAC air-system socket is recommended. For grid-driven applications, the SK-1300 is used; for cathode-driven circuits, the SK-1320 should be used, as the grid is grounded to the socket frame in this unit.

COOLING - The maximum temperature rating for the external surfaces of the 3CX20,000A7 is 250°C. Sufficient forced-air cooling must be provided to maintain the temperature of the anode core and the ceramic/metal seals below the maximum rating. Air flow should be applied before or simultaneously with the application of electrode voltages (including the filament) and should normally be maintained for a short period of time after all voltages are removed to allow for tube cool-down.

Minimum air flow requirements (for air flowing in a base to anode direction) to maintain core and seal temperatures below 225°C with an inlet temperature of 50°C are tabulated here. Pressure drop for this tabulation is measured across the anode cooler and does not include drop across a socket or chimney. In cases where the

tube base is not directly in the anode cooling air stream, provision should be made to direct an air stream of at least 50 CFM at the base from a 1-1/2 inch nozzle, or make other provision to conduct heat from the filament and grid terminals.

Anode Dissipation * kW	Sea Level		10,000 Feet Alt.	
	Air Flow CFM	Pressure Drop In. Water	Air Flow CFM	Pressure Drop In. Water
7.5	122	.25	203	.45
10.0	241	.70	350	1.00
12.5	400	1.40	580	2.25
15.0	590	2.45	940	3.90
17.5	840	4.25	1320	6.70
20.0	1180	6.90	1710	10.00

- * Since the power dissipated by the filament is about 1000 watts, and since the grid dissipation can represent another 500 watts, allowance has been made in preparing this tabulation for an additional 1500 watts of dissipation.

FILAMENT OPERATION - The rated filament voltage for the 3CX20,000A7 is 6.3 volts. Filament voltage, as measured at the socket, should be maintained at this value to obtain maximum tube life. In no case should it be allowed to deviate from the rated value by more than plus or minus five percent.

INPUT CIRCUIT - When the 3CX20,000A7 is operated as a grounded-grid rf amplifier, the use of a resonant tank in the cathode circuit is recommended in order to obtain greatest linearity and power output. For best results with a single-ended amplifier, it is suggested that the cathode tank circuit operate at a "Q" of two or more.

CLASS-C OPERATION - Although specifically designed for Class-B service, the 3CX20,000A7 may be operated as a Class-C power amplifier or oscillator. The zero-bias characteristic of the 3CX20,000A7 can be used to advantage in Class-C amplifiers by employing only grid-leak bias. If driving power fails, plate dissipation is then kept to a low value because the tube will be operating at the normal static zero-bias conditions.

INTERELECTRODE CAPACITANCE - The actual internal interelectrode capacitance of a tube is influenced by many variables in most applications, such as stray capacitance to the chassis, capacitance added by the socket used, stray capacitance between tube terminals, and wiring effects. To control the actual capacitance values within the tube, as the key component involved, the industry and the Military Services use a standard test procedure as described in Electronic Industries Association Standard RS-191. This requires the use of specially constructed test fixtures which effectively shield all external tube leads from each other and eliminates any capacitance reading to "ground". The test is performed on a cold tube. Other factors being equal, controlling internal tube

capacitance in this way normally assures good interchangeability of tubes over a period of time, even when the tube may be made by different manufacturers. The capacitance values shown in the manufacturer's technical data, or test specifications, normally are taken in accordance with Standard RS-191.

The equipment designer is therefore cautioned to make allowance for the actual capacitance values which will exist in any normal application. Measurements should be taken with the socket and mounting which represent approximate final layout if capacitance values are highly significant in the design.

HIGH VOLTAGE - The 3CX20,000A7 operates at voltages which can be deadly, and the equipment must be designed properly and operating precautions must be followed. Equipment must be designed so that no one can come in contact with high voltages. All equipment must include safety enclosures for high-voltage circuits and terminals, with interlock switches to open the primary circuits of the power supplies and to discharge high-voltage condensers whenever access doors are opened. Interlock switches must not be bypassed or "cheated" to allow operation with access doors open. Always remember that HIGH VOLTAGE CAN KILL.

SPECIAL APPLICATIONS - If it is desired to operate this tube under conditions widely different from those given here, write to Power Grid Tube Division, EIMAC Division of Varian, 301 Industrial Way, San Carlos, CA 94070, for information and recommendations.
