^eThis capacitance, which effectively is the output impedance of the tube, is increased when the tube is mounted in the deflecting-yoke assembly. The resistive component of the output impedance is in order of 100 megohms.

^cThe maximum voltage difference between grids No.6 & 3 and No.5 should not exceed 750 volts.

^dVideo amplifiers must be designed properly to handle peak target currents of this magnitude to avoid amplifier overload or picture distortion.

^eUnder the following conditions: The light source is a tungsten-filament lamp having a lime-glass envelope. It is operated at a color temperature of 3100° K. These illumination values are incident on the filters shown in (f) which are interposed between the light source and tube faceplate.

^fThese characteristics are measured using the following standard optical filters, or equivalent:
