ML-6427

General Purpose Triodes
55 kW CW
2.1 Mw Pulse Power

DESCRIPTION

The ML-6426 and ML-6427 are general-purpose triodes suitable for industrial heating, AM broadcasting and pulse modulation. These tubes feature coaxial mounting structures providing high-dissipation, low-inductance rf electrode terminals. The cathode of each type consists of sturdy, self-supporting, stress-free, thoriated-tungsten filaments.

The ML-6426 has a water-cooled, heavy-wall anode capable of dissipating 40 kW. The ML-6427 has a forced-air-

cooled, heavy-wall anode with high-efficiency disc fins capable of dissipating 20 kW.

These tubes will operate with plate voltages up to 12.5 kV in CW operation or 35 kV in pulse modulator service. Maximum ratings apply at frequencies up to 30 MHz. Useful power output can be obtained at frequencies up to 70 MHz with reduced ratings. In a typical pulse modulator application these tubes are capable of switching 2.1 Mw.

GENERAL CHARACTERISTICS

Mechanical

Mounting Position	Vertical, anode down
Type of Cooling — ML-6426	Water and forced-air†
Water flow on anode, minimum for 40 kW dissipation	20 gpm
Maximum outgoing water temperature	70 °C
Type of Cooling — ML-6427	Forced-air
Air flow on anode, minimum for 20 kW dissipation*	Pressure: Exhaust: 1000 cfm at 7.7" water 1150 cfm at 8.4" water
Maximum incoming air temperature	50 °C
Maximum Envelope Temperature	165 °C†
Net Weight, approximate	
ML-6426	13 lbs.
ML-6427	30 lbs.

*When used with Machlett ML-6427 Air Distributor, F-17798.

†At frequencies up to 15 MHz, normal cabinet ventilation should be sufficient to cool glass portions of tube. At higher frequencies or high ambient temperatures, auxiliary air flow of 50-150 cfm may be required and should be distributed

‡When ordering for this application add the suffix "P" to the Machlett tube number.

* For applications requiring longer pulse duration or higher duty factors, consult the Machlett Engineering Department.

CAUTION, X-RAYS: This device may produce x-rays when energized. Operating personnel must be protected by appropriate shielding. X-ray warning signs or labels should be permanently attached to equipment directing operating personnel never to operate this device without x-ray shielding in place.

APPLICATION NOTES

The handling of high power requires particular attention to the removal of power under fault conditions, since the large amount of energy involved can severely damage the electron tube if not properly controlled. Therefore the ground leads of the plate and grid circuits should be

equipped with individual quick-acting overload relays which will remove power from these circuits within 1/10 second.

Additional protection is recommended and may be obtained by connecting a resistor in series with the plate lead of each tube for protection of the tube during the time required for the plate overload relay to act. The criterion is the total energy to which the tube can be subjected. The minimum value of resistance which will give adequate protection with reasonably low power loss is as follows:

Maximum Power Output

of Rectifier	80	160	320	640	kW
Series Resistor	15	25	40	60	ohms

MAXIMUM FREQUENCY RATINGS

Maximum ratings apply at frequencies up to 30 MHz except as noted. The tube may be operated at higher frequencies provided the maximum values of plate voltage and plate input are reduced according to the tabulation below (other maximum ratings are the same as shown above). Special attention should be given to adequate ventilation of the bulb at the higher frequencies.
