

DESCRIPTION AND RATING

The 6FQ7 is a general-purpose, medium-mu twin triode of the 9-pin miniature type intended particularly for use as a vertical-deflection oscillator or horizontal-deflection oscillator in television receivers.

MECHANICAL

Mounting Position—Any

Envelope—T-6½, Glass

Base—E9-1, Small Button 9-Pin

Outline Drawing—EIA 6-3

Maximum Diameter..... 7⁄8 Inches

Maximum Over-all Length..... 2 5⁄8 Inches

Maximum Seated Height..... 2 3⁄8 Inches

MAXIMUM RATINGS

Design-Maximum ratings are limiting values of operating and environmental conditions applicable to a bogey electron tube of a specified type as defined by its published data and should not be exceeded under the worst probable conditions.

The tube manufacturer chooses these values to provide acceptable serviceability of the tube, making allowance for the effects of changes in operating conditions due to variations in the characteristics of the tube under consideration.

The equipment manufacturer should design so that initially and throughout life no design-maximum value for the intended service is exceeded with a bogey tube under the worst probable operating conditions with respect to supply-voltage variation, equipment component variation, equipment control adjustment, load variation, signal variation, environmental conditions, and variations in the characteristics of all other electron devices in the equipment.

The tubes and arrangements disclosed herein may be covered by patents of General Electric Company or others. Neither the disclosure of any information herein nor the sale of tubes by General Electric Company conveys any license under patent claims covering combinations of tubes with other devices or

elements. In the absence of an express written agreement to the contrary, General Electric Company assumes no liability for patent infringement arising out of any use of the tubes with other devices or elements by any purchaser of tubes or others.

MAXIMUM RATINGS (Cont'd)

DESIGN-MAXIMUM VALUES, EACH SECTION CLASS A₁ AMPLIFIER

Plate Voltage	330	Volts
Positive DC Grid Voltage	0	Volts
Plate Dissipation, Either Plate	4.0	Watts
Plate Dissipation, Both Sections		
Operating	5.7	Watts
Cathode Current	22	Milliamperes
Heater-Cathode Voltage		
Heater Positive with Respect to Cathode		
DC Component	100	Volts
Total DC and Peak	200	Volts
Heater Negative with Respect to Cathode		
Total DC and Peak	200	Volts
Grid Circuit Resistance		
With Fixed Bias	1.0	Megohms

HORIZONTAL-DEFLECTION OSCILLATOR ‡

DC Plate Voltage	330	Volts
Peak Negative-Pulse Grid Voltage	660	Volts
Plate Dissipation, Either Plate	4.0	Watts
Plate Dissipation, Both Sections		
Operating	5.7	Watts
DC Cathode Current	22	Milliamperes
Peak Cathode Current	330	Milliamperes
Heater-Cathode Voltage		
Heater Positive with Respect to Cathode		
DC Component	100	Volts
Total DC and Peak	200	Volts
Heater Negative with Respect to Cathode		
Total DC and Peak	200	Volts
Grid Circuit Resistance	2.2	Megohms

VERTICAL-DEFLECTION OSCILLATOR ‡

DC Plate Voltage	330	Volts
Peak Negative-Pulse Grid Voltage	440	Volts
Plate Dissipation, Either Plate	4.0	Watts
Plate Dissipation, Both Sections		
Operation	5.7	Watts
DC Cathode Current	22	Milliamperes
Peak Cathode Current	77	Milliamperes

Heater-Cathode Voltage		
Heater Positive with Respect to Cathode		
DC Component	100	Volts
Total DC and Peak	200	Volts
Heater Negative with Respect to Cathode		
Total DC and Peak	200	Volts
Grid Circuit Resistance	2.2	Megohms

CHARACTERISTICS AND TYPICAL OPERATION

CLASS A₁ AMPLIFIER, EACH SECTION

Plate Voltage	90	250	Volts
Grid Voltage	0	-8.0	Volts
Amplification Factor	20	20	
Plate Resistance, approximate	6700	7700	Ohms
Transconductance	3000	2600	Micromhos
Plate Current	10	9.0	Milliamperes
Grid Voltage, approximate			
I _b = 10 Microamperes	-7.0	-18	Volts
Plate Current, approximate			
E _c = -12.5 Volts		1.3	Milliamperes

* For parallel heater operation, the equipment designer should design the equipment so that the heater voltage is centered at the specified bogey value, with heater supply variations restricted to maintain heater voltage within the specified tolerance. For series heater operation, the equipment designer should design the equipment so that heater current is centered at the specified bogey value, with heater supply variations restricted to maintain heater current within the specified tolerance.

† Heater voltage for a bogey tube at I_f = 0.6 amperes.

‡ Heater current of a bogey tube at E_f = 6.3 volts.

§ The time required for the voltage across the heater to reach 80 percent of its rated value after applying 4 times rated heater voltage to a circuit consisting of the tube heater in series with a resistance equal to 3 times the rated heater voltage divided by the rated heater current.

¶ Without external shield.

* For operation in a 525-line, 30-frame television system as described in "Standards of Good Engineering Practice Concerning Television Broadcast Stations," Federal Communications Commission. The duty cycle of the voltage pulse must not exceed 15 percent of one scanning cycle.
