MAXIMUM RATINGS (Cont'd)

Design-Center ratings are limiting values of operating and environmental conditions applicable to a bogey electron tube of a specified type as defined by its published data and should not be exceeded under normal conditions.

The tube manufacturer chooses these values to provide acceptable serviceability of the tube in average applications, making allowance for normal changes in operating conditions due to rated supply-voltage variation, equipment

component variation, equipment control adjustment, load variation, signal variation, environmental conditions, and variations in the characteristics of the tube under consideration and of all other electron devices in the equipment.

The equipment manufacturer should design so that initially no design-center value for the intended service is exceeded with a bogey tube under normal operating conditions at the stated normal supply voltage.

	Pentode Section		Triode Section	
Plate Voltage	200	100	200	Volts
Screen Voltage	200	100	---	Volts
Grid-Number 1 Voltage	0	-1.0	-2.0	Volts
Amplification Factor	---	---	70	
Plate Resistance, approximate	---	400000	20000	Ohms
Transconductance	---	5500	3500	Micromhos
Plate Current	12.5	6.0	3.5	Milliamperes
Screen Current	3.5	1.7	---	Milliamperes
Grid Voltage, approximate Ic = +0.3 Microamperes	---	---	-1.3	Volts
Grid-Number 1 Voltage, approximate Ic1 = +0.3 Microamperes	---	-1.3	---	Volts
Grid-Number 1 Voltage, approximate Ib = 10 Microamperes	-16	---	---	Volts

NOTES

- * The equipment designer should design the equipment so that heater voltage is centered at the specified bogey value, with heater supply variations restricted to maintain heater voltage within the specified tolerance.
- Heater current of a bogey at Ef = 6.3 volts.
- ▲ Without external shield.
