

PLANAR TRIODE

DESCRIPTION AND RATING

FOR GROUNDED-GRID OSCILLATOR, AMPLIFIER, AND
FREQUENCY MULTIPLIER SERVICE

Metal and Ceramic
High Transconductance

Pulse Rated
Shock Resistant

100 Watts Plate Dissipation

The 7289 is a metal-and-ceramic, high- μ triode designed for use as a grounded-grid CW oscillator, amplifier, or frequency multiplier at frequencies as high as 2500 megacycles. In addition, it may be used as a plate-pulsed oscillator or amplifier at frequencies as high as 3000 megacycles.

Features of the 7289 include planar electrode construction, high plate dissipation capability, excellent electrode isolation, low radio-frequency losses, high transconductance, and low interelectrode capacitances.

GENERAL

ELECTRICAL

Cathode—Coated Unipotential	
Heater Characteristics and Ratings	
Heater Voltage, AC or DC	* Volts
Heater Current at $E_f = 6.0$ volts	1.0† Amperes
Cathode Heating Time, minimum	.60 Seconds
Direct Interelectrode Capacitances‡	
Grid to Plate: (g to p)	2.0 pf
Grid to Cathode: (g to k)	6.3 pf
Plate to Cathode:	
(p to k), maximum	0.035 pf

MECHANICAL

Mounting Position—Any—Only Plate Flange to be Used as a Socket Stop and Clamp	
Net Weight, approximate	2.5 Ounces
Cooling	
Plate and Plate Seal—Conduction and Forced Air	
Grid and Cathode Seals—Conduction and Forced Air	
Recommended Air Flow Cowling—157-JAN	
Recommended Air Flow on Plate Radiator at Sea Level	
Incoming Air Temperature 25C, Plate Dissipation 100 Watts	12.5 Cu.Ft.PerMin.

MAXIMUM RATINGS

ABSOLUTE-MAXIMUM VALUES

RADIO-FREQUENCY POWER AMPLIFIER AND OSCILLATOR—CLASS C TELEGRAPHY

Key-Down Conditions Per Tube Without Amplitude Modulation§		Peak Negative RF Grid Voltage	400 Volts
Heater Voltage*	4.5 to 5.7 Volts	DC Grid Current	50 Milliamperes
Frequency	2500 Megacycles	DC Cathode Current	125 Milliamperes
DC Plate Voltage	1000 Volts	Plate Dissipation	100 Watts
Negative DC Grid Voltage	150 Volts	Grid Dissipation	2.0 Watts
Peak Positive RF Grid Voltage	30 Volts	Envelope Temperature at Hottest Point	300 C

RADIO-FREQUENCY POWER AMPLIFIER AND OSCILLATOR—CLASS C TELEPHONY

Carrier Conditions Per Tube For Use With a Maximum Modulation Factor of 1.0		Peak Negative RF Grid Voltage	400 Volts
Heater Voltage*	4.5 to 5.7 Volts	DC Grid Current	50 Milliamperes
Frequency	2500 Megacycles	DC Cathode Current	100 Milliamperes
DC Plate Voltage¶	600 Volts	Plate Dissipation	70 Watts
Negative DC Grid Voltage	150 Volts	Grid Dissipation	2.0 Watts
Peak Positive RF Grid Voltage	30 Volts	Envelope Temperature at Hottest Point	300 C

PLATE-PULSED OSCILLATOR OR AMPLIFIER

Heater Voltage*	5.7 to 6.0 Volts	Negative Grid Voltage	
Frequency	3000 Megacycles	Average During Plate Pulse‡†	
Peak Positive-Pulse Plate Supply		Grid Current	
Voltage	3500 Volts	Average During Plate Pulse	
Duty Factor of Plate Pulse Δ	0.0025	Plate Dissipation Δ	
Pulse Duration	3.0 Microseconds	Grid Dissipation Δ	
Plate Current		Envelope Temperature at Hottest Point	
Average During Plate Pulse Δ^{**}	3.0 Amperes		

CHARACTERISTICS AND TYPICAL OPERATION

Grid Current		
Average During Plate Pulse.....	1.8	Amperes
Useful Power Output		
Average During Plate Pulse.....	1.6	Kilowatts

* The equipment designer should design the equipment so that heater voltage is centered at some value within the range of 4.5 to 5.7 volts for CW operation, or 5.7 to 6.0 volts for pulse operation. Heater voltage variations about the center value should be kept as small as practical and should not, in any case, exceed $\pm 5\%$. The optimum center value of heater voltage depends on the cathode current and on other parameters of circuit design and operation. For specific recommendations, contact your General Electric tube sales representative.

† Heater current of a bogey tube at $E_f = 6.0$ volts.

‡ Measured in a special shielded socket.

§ Modulation essentially negative may be used if the positive peak of the audio-frequency envelope does not exceed 115% of the carrier conditions.

¶ For modulation factors less than 1.0, a higher d-c plate voltage may be used if the sum of the peak positive audio voltage and the d-c plate voltage does not exceed 1200 volts.

* Applications with a duty factor greater than 0.0025 should be referred to your General Electric tube sales representative for recommendations.

△ In any 5000-microsecond interval.

** The regulation and/or series plate-supply impedance must be such as to limit the peak current, with the tube considered a short circuit, to a maximum of 30 amperes.

†† The maximum instantaneous value should be within the range of +250 to -750 volts.

§§ Adjusted for $I_b = 70$ milliamperes.

Absolute-Maximum ratings are limiting values of operating and environmental conditions applicable to any electron tube of a specified type as defined by its published data and should not be exceeded under the worst probable conditions.

The tube manufacturer chooses these values to provide acceptable serviceability of the tube, making no allowance for equipment variations, environmental variations, and the effects of changes in operating conditions due to variations in the characteristics of the tube under consideration and of

all other electron devices in the equipment.

The equipment manufacturer should design so that initially and throughout life no absolute-maximum value for the intended service is exceeded with any tube under the worst probable operating conditions with respect to supply-voltage variation, equipment component variation, equipment control adjustment, load variation, signal variation, environmental conditions, and variations in the characteristics of the tube under consideration and of all other electron devices in the equipment.

The tubes and arrangements disclosed herein may be covered by patents of General Electric Company or others. Neither the disclosure of any information herein nor the sale of tubes by General Electric Company conveys any license under patent claims covering combinations of tubes with other devices or

elements. In the absence of an express written agreement to the contrary, General Electric Company assumes no liability for patent infringement arising out of any use of the tubes with other devices or elements by any purchaser of tubes or others.

INITIAL CHARACTERISTICS LIMITS

	Min.	Max.	
Heater Current			
Ef = 6.0 volts.....	0.90	1.05	Amperes
Grid Voltage			
Ef = 6.0 volts, Eb = 1000 volts, Ib = 100 ma.....	-2.0	-7.0	Volts
Grid Voltage			
Ef = 6.0 volts, Eb = 1000 volts, Ib = 1.0 ma.....		-25	Volts
Negative Grid Current			
Ef = 6.0 volts, Eb = 1000 volts, Ec adjusted for Ib = 100 ma.....		8.0	Microamperes
Interelectrode Leakage Resistance			
Ef = 6.0 volts, Polarity of applied d-c interelectrode voltage is such that no cathode emission results			
Grid to Cathode at 500 volts d-c.....	50		Megohms
Interelectrode Capacitances			
Grid to Plate: (g to p).....	1.95	2.15	Picofarads
Grid to Cathode: (g to k).....	5.6	7.0	Picofarads
Plate to Cathode: (p to k).....		0.035	Picofarads

SPECIAL PERFORMANCE TESTS

	Min.	Max.	
Oscillator Power Output			
Tubes are tested for power output as an oscillator under the following conditions: Ef = 5.0 volts; F = 2500 MC, min.; Eb = 1000 volts; Ib = 90 ma.....	15		Watts
Pulsed-Oscillator Power Output			
Tubes are tested for power output as an oscillator under the following conditions: Ef = 5.8 volts; F = 3000 MC, min.; epy = 3500 volts; tp = 3.0 μ sec. $\pm 10\%$; Du = 0.0025 $\pm 5\%$; Rg adjusted for Ib = 7.5 ma; Ec = -1.5 volts, max.; Ic = 4.5 ma, max.....	4.0		Watts
Low Pressure Voltage Breakdown Test			
Statistical sample tested for voltage breakdown at a pressure of 54 mm Hg. Tubes shall not give visual evidence of flashover when 1000 volts RMS, 60 cps, is applied between the plate and grid terminals.			

DEGRADATION RATE TESTS

Shock

Statistical sample subjected to 5 impact accelerations of approximately 400 G and 0.5 milliseconds duration in each of three positions. The accelerating forces are applied by the Navy-type, High Impact (flyweight) Shock Machine.

500-Hour Life Test

Statistical sample operated for 500 hours as an oscillator to evaluate changes in power output with life.

NOTES

1. The total indicated runout of the plate contact surface with respect to the cathode contact surfaces will not exceed .020 inch.
2. The total indicated runout of the cathode contact surface with respect to the heater contact surfaces will not exceed .012 inch.
3. The total indicated runout of the grid contact surface with respect to the cathode contact surface will not exceed .020 inch.
4. Do not clamp or locate on this surface.
5. Hole provided for tube extractor through the top fin only.
6. Measure plate shank temperature on this surface.
