IGNITRONRECTIFIER SERVICE - 400 AMPERES
AC CONTROL SERVICE - 4800 KILOVOLT-AMPERESAUXILIARY ANODE
TWO IGNITORS

GENERAL

Electrical

Cathode-Excitation - Cyclic

Cathode Spot Starting - Ignitor

Number of Electrodes

Main Anodes..... 1

Main Cathodes..... 1

Auxiliary Anodes..... 1

Ignitors..... 2

Control Grids..... 1

Arc Drop at 1200 Peak Amperes..... 18.2±0.1 Volts

Arc Drop at 8000 Peak Amperes..... 35±0.1 Volts

Mechanical

Envelope Material - Stainless Steel

Net Weight, approximate..... 90 pounds

Thermal

Type of Cooling - Water

Inlet Water Temperature*, minimum..... 35 C

Outlet Water Temperature, maximum

Power-Rectifier Service

Peak Inverse Anode Voltage=900 Volts..... 60 C

Peak Inverse Anode Voltage=2100 Volts..... 50 C

AC Control Service

Voltage=250 Volts RMS..... 45 C

Voltage=600 Volts RMS..... 45 C

Voltage=2400 Volts RMS..... 45 C

Water Flow, minimum

* Dependent upon load conditions. For substantially constant load 0 C is satisfactory. For widely fluctuating loads 25 C is required.

+ At main anode voltages of 500 volts and over, the grid circuit should provide a negative d-c bias of 100 volts and a suitable turn-on voltage to swing the grid positive at the time the ignitor is fired. At lower anode voltages, it is sufficient to connect the grid to the main anode through a resistor. In either case, the grid circuit resistance should be 500 to 1000 ohms.

‡ RMS demand voltage, current, and kilovolt-ampere demand are all on the basis of full-cycle conduction (no phase delay) regardless of whether or not phase control is used. For voltages below the minimum, the minimum-voltage current rating applies. With the use of log-log paper straight-line interpolation between tabulated points may be used for other detailed ratings of: Demand kva vs average anode current, and maximum averaging time vs anode voltage.
