

CATHODE-RAY TUBE

TYPE 7BAP-

The Du Mont Type 7BAP- is a 4 x 6-inch rectangular, dual beam, electrostatic focus and deflection cathode-ray tube. Post acceleration is used to obtain maximum deflection sensitivity with high brightness. The electron gun structures are so designed as to require no appreciable focusing current. The deflection-electrode connections are brought out through the neck to minimize lead inductance and capacitance and to improve insulation.

NOTES

1. Values are for each unit unless otherwise stated.
2. This tube is designed for optimum performance when operating at an Eb3/Eb2 ratio of 2.0. Operation at other ratios of Eb3/Eb2 may result in changes in deflection uniformity and pattern distortion.
3. Visual extinction of the focused, undeflected spot.
4. Measured in accordance with MIL-E-1 specifications, using a beam current of 25 μ ADC.
5. The deflection of one beam when balanced DC voltages are applied to the deflection electrodes of the other beam will not be greater than the indicated value.
6. With the tube shielded against external influences, and the deflecting electrodes connected to the accelerator, the undeflected and focused spot will fall within a 15-mm square centered on the tube face, one side of which is parallel to the D3D4 trace.
7. The deflection factor (for both D1D2 and D3D4 plate pairs, separately) for any deflection of less than 75% of the useful screen will not differ from the deflection factor for a deflection at 25% of the useful screen by more than the indicated value.
8. Ratio of deflection factors of corresponding sets of deflection plates (larger deflection factor divided by lower deflection factor) will not exceed 1.15.
9. It is recommended that the deflection-electrode circuit resistances be approximately equal.
