^a With external shield up to flange seal.

^b Subscript 1 indicates that grid-No.1 current does not flow during any part of the input cycle.

^c Continuous Commercial Service.

^d Averaged over any audio-frequency cycle of sine-wave form.

^e Obtained preferably from a separate source or from the plate-voltage supply with a voltage divider.

- f The type of input-coupling network used should not introduce too much resistance in the grid-No.1 circuit. Transformer or impedance coupling devices are recommended. When grid No.1 is operated in the negative region with fixed bias, the dc grid-No.1-circuit resistance should not exceed 100000 ohms. Cathode bias is not recommended.
- g Intermittent Commercial and Amateur Service.
- h Obtained preferably from a separate source modulated with the plate supply, or from the modulated plate supply through a series resistor.
- j Obtained from grid-No.1 resistor or from a combination of grid-No.1 resistor with either fixed supply or cathode resistor.
- k In ICAS applications at frequencies less than 20 Mc where duty factor does not exceed 0.2, maximum "on" period does not exceed 30 seconds, and average modulation factor does not exceed 0.25, maximum grid-No.2 input of 12 watts is permitted.
- m Key-down conditions per tube without amplitude modulation. Modulation essentially negative may be used if the positive peak of the audio-frequency envelope does not exceed 115 per cent of the carrier conditions.
- n Obtained preferably from a separate source, or from the plate supply voltage with a voltage divider, or through a series resistor. A series grid-No.2 resistor should be used only when the 829B is used in a circuit which is not keyed. Grid-No.2 voltage must not exceed 600 volts under key-up conditions.
- p Obtained from fixed supply, by grid No.1 resistor, by cathode resistor, or by combination methods.

SHIELDING AND BYPASSING

Shielding of the 829B in an rf amplifier is required for stable operation. A convenient method of shielding is to mount the tube with one end through a hole in a metal plate so that the edge of the hole is close to the internal shield of the tube. Due to the importance, at the very-high frequencies, of obtaining the shortest leads possible, rf bypassing must be accomplished close to the tube terminals. Ribbon leads acting as plates of the bypass capacitors are effective. All circuit returns should be made to the common cathode connection. RF chokes may be advisable in the voltage-supply leads.
