

CATHODE RAY TUBE CHARACTERISTIC SHEETProposed DataType 9MP7Physical Characteristics

Focusing method	Magnetic
Deflecting method	Magnetic
Maximum solid deflecting angle	55°
Phosphor	P7
Overall length	17½" ± ½"
Greatest diameter of bulb	9" ± 1/8"
Minimum usable screen diameter	8¼"
Bulb type	J72R2
Base RMA Designation	8 Pin Octal
Bulb contact RMA Designation	Medium Metal
Basing RMA Designation	5AN
Spot Centering ¹	20 MM Radius
Direct Electrode Capacitances (Maximum)	
Grid #1 to all others	11 mmf.
Cathode to all others	9 mmf.

Electrical CharacteristicsRatings

Heater Voltage ²	6.3 volts
Heater Current	0.6 amps
High Voltage Electrode	7700
Grid #2 (Accelerating Electrode) Voltage ⁵	330
Grid #1 (Control Electrode)	never positive
D.C. Heater Cathode Potential ³	-125 volts max.
Grid Circuit Resistance	1.5 megohms max.

Typical Conditions

High voltage electrode	4000	6000	
Grid #2 voltage ⁵	250	250	
Grid #1 voltage for cutoff ⁴	-50	-50	± 50%
Grid #2 Current	100	100	ma. Max.

Notes

1. The centre of the undeflected spot will fall within a circle of given radius concentric with the tube face.
2. Heater voltage and heater current allowable variation ±10% .
3. With heater negative, Cathode should be connected to the mid-tap or to one side of heater supply.
4. Cut-off voltage is voltage necessary for visual extinction of a stationery focused spot.
5. Grid #2 may or may not be present. However the socket should be wired to accommodate a Grid #2 when present. On tubes without G₂, E_c, for cut-off varies as E_b, being 50 volts ±50% at E_b = 6000 volts.

HIGH VACUUM CATHODE RAY TUBE 9MP7.

PIN NO.	ELEMENT
