CONTROL OF CONDENSED MERCURY TEMPERATURE

On the following pages two curves are given showing:

1. Total heating time for any value of ambient temperature. This is for use when the valve is being switched on from cold.
2. Rise of condensed mercury temperature above ambient plotted against heating and cooling time. This can be used as indicated by the example in the preamble to this section of the catalogue.

MAXIMUM OPERATING CONDITIONS

(Absolute Values—see Preamble)

Circuit	* Dia- gram	Con- densed Mercury Temp. °C	Peak Inverse Voltage (50-60 c/s) kV	Anode current in Amperes		Trans- former Secondary Voltage (R.M.S.) kV	Max D.C. Output	
				Peak	Mean†		kV	Amps
Single Phase Full Wave	A	25-50	16	8	2.0	5.6	5.0	4
Single Phase Full Wave Bridge	B	25-50	16	8	2.0	11.2	10.1	4
Three Phase Half Wave	C	25-50	16	8	2.0	6.5†	7.6†	6
Three Phase Full Wave	D	25-50	16	8	2.0	6.5	15.2	6

*For diagrams see Typical Rectifier Circuits for Choke Input Filters in the preamble to this section of the catalogue.

†For operation with constant full load. If the load resistance is increased the secondary voltage should be decreased (to avoid excessive peak inverse voltage) until at no load the reduction is 14%. The D.C. output voltage will be correspondingly decreased.

‡Mean anode currents are averaged over any period of 30 seconds maximum.
