

CY 1 Rectifying valve

Fig. 2
Arrangement of
electrodes and
base connections.

Philips CY 1 is a half-wave rectifying valve taking a heater current of 200 mA at 20 volts. The internal resistance is very low and the anode current therefore produces only a very slight decrease in the voltage. In the applications of the CY 1, it is well to bear in mind that the peak voltage between filament and cathode must not exceed 450 V; on high mains voltages, when large-capacitance smoothing capacitors are used, a resistor should be included in the anode circuit to safeguard the valve. The minimum value of this resistor will be found in the following table:

Mains voltage	Smoothing capacitor	Series resistor
Max. 250 V	32 μ F	Min. 125 ohms
	16 μ F	Min. 75 ohms
	8 μ F	0 ohms
Max. 170 V	32 μ F	Min. 75 ohms
	16 μ F	Min. 30 ohms
	8 μ F	0 ohms
Max. 127 V	32 μ F	0 ohms
	16 μ F	0 ohms
	8 μ F	0 ohms

HEATER RATINGS

Heating: indirect, A.C. or D.C., series supply.

Heater voltage . . . $V_f = 20$ V

Heater current . . . $I_f = 0.200$ A

MAXIMUM RATINGS

Anode voltage, A.C.

$$V_i = \text{max. } 250 \text{ V}_{\text{(eff)}}$$

Direct current $I_o = \text{max. } 80$ mA

Voltage between heater and

cathode . . . $V_{fk} = \text{max. } 450$ V
