¹⁾²⁾³⁾⁴⁾⁵⁾ See page 4

- 1) In general the voltages on g_6 , g_5 , g_4 and the average potential of the deflection plates should be equal. Variation of the isolation shield voltage V_{g6} (max. $\pm 10\%$ of V_{g4}) serves to correct pincushion and barrel pattern distortion.
Adjustment of the deflection plate shield voltage V_{g5} (max. $\pm 5\%$ of V_{g4}) provides improved linearity of vertical deflection.
A small potential difference (max. $\pm 5\%$ of V_{g4}) between the y plates and g_4 may be desirable for obtaining optimum sharpness.
- 2) For visual extinction of the focused spot
- 3) The sensitivity for a deflection of less than 75% of the useful scan will not differ more than 2 % from the sensitivity for a deflection of 25% of the useful scan
- 4) With a raster pattern the size of which is such that the widest points of the pattern just touch the sides of a rectangle of 100x60 mm, no points of the pattern sides will be within a concentric rectangle of 98x58.5 mm
- 5) With the tube shielded the spot will be within a circle of 5 mm radius, the circle being centered with respect to the tube face
- 6) If use is made of the full deflection capabilities of the tube, the deflection plates will intercept part of the electron beam near the edge of the scan; a low impedance deflection plate drive is therefore desirable
- 7) Values to be taken into account for the calculation of the V_{g3} -potentiometer
