$V_{in(r.m.s.)}$	8.0	8.2	V
* P_{out}	11	11	W
* D_{tot}	10	10	%

* P_{out} and D_{tot} are measured at fixed bias and therefore represent the power output available during the reproduction of speech and music. When a sustained sine wave is applied to the control-grid the bias across the cathode resistor will readjust itself as a result of the increased anode and screen-grid currents. This will result in a reduction in power output of approximately 10%.
