Grid No.2 voltage	V_{g2}	190	V_{g2}	190 V
Grid No.1 voltage	V_{g1}	-1	V_{g1}	-17 V
Anode current	I_{ap}	320	I_a	60 mA
Grid No.2 current	I_{g2}	approx. 60	I_{g2}	5 mA
Transconductance			S	9 mA/V
Amplification factor			μ_{g2g1}	8 -

Remarks.

The minimum I_a to be expected as a result of spread of the tube characteristics tube deterioration during life and decrease of the mains voltage to 10 % below the nominal value can be derived from the curves on page B by decreasing by 40 % the I_a values situated on the curve A-B at V_{g2} occurring at the decreased mains voltage.

In order not to exceed the maximum permissible value of W_{g2} , the circuit should be designed in such a way that the anode voltage should never be lower than the value determined by curve A-B at the relevant V_{g2} value.
