

## INDICATOR TUBE

Cold cathode ten digit side viewing numeral indicator tube

| QUICK REFERENCE DATA              |                     |          |    |
|-----------------------------------|---------------------|----------|----|
| Numeral height                    |                     | 13       | mm |
| Numerals                          | 1 2 3 4 5 6 7 8 9 0 |          |    |
| Supply voltage                    | $V_b$               | min. 170 | V  |
| Cathode current                   | $I_k$               | 2        | mA |
| Distance between mounting centres |                     | min. 19  | mm |

### GENERAL

The numerals are 13 mm high and appear on the same base line allowing in-line read out. The ZM1080 is provided with a red contrast filter. The ZM1082 is identical to the ZM1080 but has no filter.

### PRINCIPLE OF OPERATION

The tube contains ten cathodes in the form of ten figures and one common anode. By applying a suitable voltage between the anode and one of the ten cathodes the corresponding figure will be covered by a red neon glow.

### DIMENSIONS AND CONNECTIONS

Dimensions in mm

Mounting position: any

The numbers are viewed through the side of the envelope. The numbers will appear upright (within  $\pm 3^\circ$ ) when the tube is mounted vertically. Care should be taken not to bend the leads nearer than 1.5 mm from the seals. The leads are tinned and may be dip soldered to a minimum of 5 mm from the seals at a solder temperature of 240 °C for a maximum of 10 seconds. The tube may be soldered directly into the circuit but heat conducted to the glass to metal seals should be kept to a minimum by the use of a thermal shunt.

## CHARACTERISTICS AND RANGE VALUES FOR EQUIPMENT DESIGN

Initially and during life at 20 °C to 50 °C unless otherwise stated.

### Ignition

|                     |       |                          |
|---------------------|-------|--------------------------|
| Anode voltage       | $V_a$ | > 170 V                  |
| Ignition delay time |       | See page 4 <sup>1)</sup> |

### Conduction

#### D.C. operation

|                                                       |          |            |
|-------------------------------------------------------|----------|------------|
| Cathode current <sup>1)</sup>                         | $I_k$    | < 3.5 mA   |
| Cathode current for coverage                          | $I_k$    | > 1.5 mA   |
| Maintaining voltage at $I_k = 2$ mA (See also page 5) | $V_m$    | 140 V      |
| Probe current to individual non-conducting cathodes   | $I_{kk}$ | See page 6 |

#### Pulse operation

|                                                     |           |                          |
|-----------------------------------------------------|-----------|--------------------------|
| Cathode current, peak                               | $I_{kp}$  | < 12 mA                  |
| average, $T_{av} = 20$ ms                           | $I_k$     | < 2.5 mA                 |
| Average cathode current for satisfactorily display  | $I_k$     | > 0.8 mA                 |
| Pulse duration                                      | $T_{imp}$ | < 20 ms<br>> 100 $\mu s$ |
| Maintaining voltage                                 | $V_m$     | See page 5               |
| Probe current to individual non-conducting cathodes | $I_{kk}$  | See pages 6 and 7        |

## EXTINCTION

|                                    |       |         |
|------------------------------------|-------|---------|
| Anode voltage to ensure extinction | $V_a$ | < 115 V |
|------------------------------------|-------|---------|

<sup>1)</sup> For reduced ignition delay times, a small continuous priming current may be taken from lead 4. This can be obtained from a supply voltage of -180 V with respect to the "on" cathode via a resistor of 18 M $\Omega$ .

# **LIFE EXPECTANCY**

Under recommended operating conditions and  $t_{amb} = \text{room}$

Continuous display of one digit <sup>1)</sup> > 5000 h

Sequentially changing the display from one digit  
to another every 100 hours or less > 30 000 h

# **LIMITING VALUES** (Absolute max. rating system)

Cathode current (each digit)

|                                                |          |      |        |
|------------------------------------------------|----------|------|--------|
| average, $T_{av} = \text{max. } 20 \text{ ms}$ | $I_k$    | max. | 3.5 mA |
| peak                                           | $I_{kp}$ | max. | 12 mA  |
| average during any conduction period           | $I_k$    | min. | 1.5 mA |

|                  |            |      |                      |
|------------------|------------|------|----------------------|
| Bulb temperature | $t_{bulb}$ | max. | +70 °C               |
|                  |            | min. | -50 °C <sup>2)</sup> |

|                                      |       |      |       |
|--------------------------------------|-------|------|-------|
| Anode voltage necessary for ignition | $V_a$ | min. | 170 V |
|--------------------------------------|-------|------|-------|

<sup>1)</sup> The life expectancy figures given above relate to operation with d.c. cathode currents between 1.5 mA to 2.5 mA and at all permitted pulsed cathode currents.

When a d.c. cathode current range of 1.5 mA to 3.5 mA is used, the life expectancy exceeds 3000 hours with continuous display of one digit.

<sup>2)</sup> For bulb temperatures below 0 °C the life expectancy of the tube is substantially reduced.

#### CUMULATIVE DISTRIBUTION OF IGNITION DELAY TIME

This curve shows the probability that a tube will ignite in less than the time shown after a non-conduction period of a few seconds. The ignition delay time will be appreciably reduced when the interval between conduction periods is less than 100 milliseconds. In general, an increase in the supply voltage will reduce the ignition delay time.

Probe currents to individual cathodes.D.C. anode current range 1.5 to 2.5mA

Probe currents to individual cathodes.D.C. anode current range 1.5 to 3.5mA

Peak probe currents to individual cathodes. Pulsed anode current 10mA  
Duty factor 0.1

### PROBE CURRENT CURVES

The boundaries A-A and B-B of the graphs represent, for the shown anode current ranges, the range of probe currents to individual non-conducting cathodes plotted against the voltage difference between the non-conducting cathodes and the conducting cathode.

For optimum display, the probe current to any non-conducting cathode should be as low as possible. In addition, reverse probe current should not be permitted.

These conditions can be satisfied in two ways:

- (1) With a low impedance voltage source connected to the non-conducting cathodes. For example, when using a current range of 1.5 to 2.5 mA and a voltage between 50 and 115 V is required.
- (2) With a separate high impedance connected to each non-conducting cathode and returned to a voltage source of less than 115 V. In this case the load line of the voltage source must lie to the right of boundary C-C.
